The sources of drinking water that were detected during the most recent sampling event. The presence of these constituents in the water does not necessarily indicate that the water poses a health risk. The CDPH requires us to monitor for certain constituents less than once per year because the concentrations of these constituents are not expected to vary significantly from year to year. Some of the data, though representative of the water quality, are more than one year old. Your water is supplied from two wells, one on Fairway Drive and the other on Blackhawk Place. A 0.3 ppm chlorine residual is maintained in the system as a safeguard against bacteriological contamination. The system is operated and maintained by the City of Davis Public Works Department through an agreement with the County Service Area. Drinking water, including bottled water, may reasonably contain small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. For more information about contaminants and potential health effects, contact the EPA's Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/Center for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

Lead and Copper Rule

Eight household tap water sampled in 2013 indicated that lead and copper were not present in concentrations higher than the current Action Level of 15 ppb for Lead and 1.3 ppm for Copper. Water was sampled during the summer months and none of the samples contained lead. Concentrations of Copper ranged from not detected to 0.61 parts per million (ppm). The next sampling event is scheduled for the summer of 2016.

Contaminants that may be present in source water include: Microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.

Inorganic contaminants, such as salts and metals, that can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.

Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm water runoff, and residential uses.

Organic chemical contaminants, including synthetic and volatile organic chemicals, that are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems. Radioactive contaminants, which can be naturally-occurring or be the result of oil and gas production and mining activities.

About Our Violations Last year, both domestic wells supplying the service area exceeded the Maximum Contaminant Level for nitrates. In an agreement with the California Department of Public Health, a Compliance Order was given to the County. The County will continue to monitor the nitrate concentrations at both well sites weekly until further notice from the Department of Health. The nitrate warning notice issued in 2009 by the Yolo County Environmental Health Department remains in effect. For more information, please contact Regina Espinoza at 530.666.8725.

The source water from the well located on Fairway Drive (NDM1) showed high levels of iron and aluminum that exceeded the Secondary Maximum Contaminant Levels (SMCL) established by the State. Secondary standards are set for aesthetic reasons; primarily to monitor for taste and odor. However, high levels of iron and aluminum may stain plumbing fixtures. The source water will now be monitored quarterly for these two constituents.

The table to the left lists drinking water constituents

that were detected during the most recent sampling event. The presence of these constituents in the water does not necessarily indicate that the water poses a health risk. The CDPH requires us to monitor for certain constituents less than once per year because the concentrations of these constituents are not expected to vary significantly from year to year. Some of the data, though representative of the water quality, are more than one year old.

In order to ensure that tap water is safe to drink, the US EPA and the California Department of Public Heath (CDPH) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. CDPH regulations also establish limits for contaminants in bottled water that must provide the same protection for public health.

Terms and Abbreviations:

Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by the U.S. Environmental Protection Agency.

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs (or MCLGs) as is economically and technologically feasible. Secondary MCLs are set to protect the odor, taste, and appearance of drinking water. NS: No Standard

Public Health Goal (PHG): The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.

Regulatory Action Level (AL): The concentration of a contaminant which, when exceeded, triggers treatment or other requirements that a water system must follow. ppb: parts per billion or micrograms per liter ppm: parts per million or milligrams per liter pCi/L: Pico curies per liter (a measure of radiation) pmhos/cm: micromhos per centimeter

>: greater than symbol.

*: Samples taken in 2013.

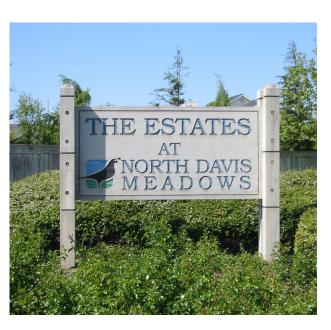

Important Information about Your Water Quality

Area

Yolo County

2013 Water Quality Report

This is a report of your water quality as required by state and federal regulations. Included are details about where your water comes from, what it contains, and how it compares to state standards.

Nitrates in Drinking Water

Both of the wells serving your area exceeded the maximum contaminant level for nitrates in 2013. Nitrate in drinking water at levels above 45 mg/L is a health risk for infants of less than six months of age. Such nitrate levels in drinking water can interfere with the capacity of the infant's blood to carry oxygen, resulting in a serious illness; symptoms include shortness of breath and blueness of the skin. Nitrate levels above 45 mg/L may also affect the ability of the blood to carry oxygen in other individuals, such as pregnant women and those with certain specific enzyme deficiencies. If you are caring for an infant, or you are pregnant, you should ask advice from your health care provider. Nitrate levels may rise quickly for short periods of time because of rainfall or agricultural activity.

Lead in Drinking Water

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The Yolo County Service Area is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead.

Arsenic in Drinking Water

While your drinking water meets the federal and state standard for arsenic, it does contain low levels of arsenic. The arsenic standard balances the current understanding of arsenic's possible health effects against the costs of removing arsenic from drinking water. The U.S. Environmental Protection Agency continues to research the health effects of low levels of arsenic, which is a mineral known to cause cancer in humans at high concentrations and is linked to other health effects such as skin damage and circulatory problems.

Source Water Assessment

An assessment of the drinking water sources for North Davis Meadows was completed in December 2003. This assessment was done in compliance with the California Department of Health Services Drinking Water Assessment and Protection Program, the goal of which is to determine the water system's vulnerability to possible sources of contamination.

The assessment determined that your groundwater is most vulnerable to historic and present-day land use activities, including agriculture, the historic use of septic systems, and golf course activities. Overall, the assessment concluded that there is a slight to moderate threat that your water source could become contaminated by these land use patterns and activities.

A copy of the complete Assessment is available at Yolo County Planning and Public Works Department. Call (530) 666-8775 for more information.

If you have further questions, please phone:

- » Leslie Lindbo, Yolo County Environmental Health (530) 666-8646
- » Don Saylor, Yolo County Supervisor (530) 666-8622
- » Regina Espinoza, Yolo County Planning & Public Works (530) 666-8725
- » Dianna Jensen, City of Davis Public Works (530) 757-5686

After hours and weekends, please contact the nonemergency number of the Davis Police at 747-5400 (dial 758-3600 if calling from a cell phone) and they will contact a certified water operator to address problems.
