Discharger: Wild Wings County Service Area
Name of Facility: Wild Wings Water Recycling Facility
MRP No: R5-2002-0077
CIWQS Place ID: 272537
County: Yolo

I am hereby submitting to the Central Valley Water Board the following information:

Check all that apply:

Technical Report Title and Date **Self-Monitoring Report for Wild Wings**

Monthly Monitoring Report for the Month of _____.

1st / 2nd / 3rd / 4th (circle one) Quarterly Monitoring Report for the year _____.

1st / 2nd (circle one) Semi-annual Monitoring Report for the year _____.

Annual Monitoring Report for the year **2017**.

Violation Notification:

During the Monitoring period there were / were not (circle one) any violations of the WDRs.

1. The Violations were: See report, Attachment 5
2. Have the violations been corrected? Yes / No. If no, what will be done to correct the violations:

Certification Statement:

"I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

Signature:

**Re: Groundwater Monitoring Report
Fourth Quarter 2017
Wild Wings Water Recycling Facility, Yolo County, CA
WDR No. R5-2002-0077**

Dear Mr. Lambeth:

Silver State Analytical Laboratories, Inc. and Frohnen Consultants are pleased to present this report as a summary of the Groundwater Monitoring Data from the Fourth Quarter of 2017.

If you have any questions regarding this report, please call David Frohnen at 702-873-4478 or Carly Wood at 775-857-2400.

Sincerely,
Silver State Analytical Laboratories, Inc.

Carly Wood
Laboratory Director

APPENDIX B – Laboratory Analytical Results & Chain of Custody

1 INTRODUCTION

Silver State Analytical Laboratories (SSAL) in conjunction with Frohnen Consultants prepared this groundwater monitoring report on behalf of National O&M, Inc. (National) for the Wild Wings Water Recycling Facility (WWRF) at the Wild Wings residential development, in Yolo County, California. This report represents and summarizes data collected and analyzed by SSAL, in conjunction with contract laboratory work, in November and December 2017; and also includes historical data and information from previous reports, consultants and laboratories.

National requested that SSAL provide groundwater monitoring and reporting for the WWRF to comply with Regional Water Quality Control Board (RWQCB) Waste Discharge Requirements (WDR) Order R5-2002-0077. The WDR requires quarterly monitoring and reporting of the groundwater levels and quality at the monitoring wells. National, under contract with Yolo County, began operating the WWRF on April 1, 2016. SSAL performed the field sampling and monitoring at the site on November 14, 2017.

1.1 LOCATION

The Wild Wings development is located north of Highway 16 and west of County Road 94B at 18530 Wildwings Drive, Woodland, CA 95695, and is surrounded by agricultural land to the west, Cache Creek and the Yolo Fliers Golf Club to the north, the Watts-Woodland Airport to the east, and several rural residences to the south. In early 2015, almond orchards were planted in the agricultural land to the west of the site and water wells were installed to provide water for the orchards. The WWRF encompasses 3.67 acres (400 by 400 feet) along the southwestern side of the Wild Wings development. Figure 1 shows the location of the WWRF along with general site information and locations of seven (7) monitoring wells.

1.2 SITE INFORMATION

The Wild Wings development consists of over 300 homes, a nine-hole golf course (including several ponds/lakes), and the WWRF, all built on 238 acres of previously undeveloped land. The WWRF has been operating since February 2005. Domestic wastewater from the Wild Wings development is treated to a tertiary level at the WWRF. The treated water is then blended with groundwater obtained from two deep on-site water supply wells and is used for irrigation of the golf course. The mixture of applied irrigation water typically consists of approximately one-fourth recycled water, but this ratio will vary by month. When irrigation demands are reduced, a lined storage pond on the WWRF site stores the recycled water. National does not operate or maintain the golf course irrigation system or ponds on the golf course.

1.3 MONITORING WELLS

Seven monitoring wells, MW-1 through MW-7, were constructed in May through June 2004. The monitoring wells were installed on the Wild Wings development in the vicinity of the WWRF. The locations of the monitoring wells are shown on Figure 1.

The WDR required that the monitoring wells be constructed to monitor the uppermost aquifer. While drilling, soil samples were collected to assess the subsurface lithology and to locate the uppermost aquifer. Review of the well logs shows that clays with various amounts of silt, sand, and gravel are predominant at the site. However, beds of coarse-grained materials, sands and gravels, with trace amounts of silt and clay were also logged at all monitoring well sites.

The monitoring wells were completed to depths ranging from 31 to 74 feet below ground surface (bgs). Each well is constructed with 2-inch schedule 40 PVC well casing and screen. The screen intervals are 10 feet in length at most wells, with the exception of MW-4 and MW-5R, which have 15- and 20-foot screen intervals, respectively. The top of each well casing is fitted with an expandable plug to prevent surface water from entering the wells. The top of each well is secured in a subsurface vault. Table 1 summarizes the well construction details.

The well screens are not at the same depth in all of the monitoring wells. The depths varied based on when groundwater was first encountered. Thick clay beds were encountered at MW-4 and MW-5R and continued to relatively deep depths. MW-4 and MW-5R have deeper screen intervals than the other monitoring wells, ranging from an elevation of 51 to 71 feet mean sea level (msl). In contrast, MW-1, MW-2, MW-6, and MW-7 are screened at shallower depths, between 73 to 95 feet msl. MW-3 has the shallowest screen interval ranging from an elevation of 90 to 100 feet msl.

The lithologic sequences of strata encountered during well drilling show a heterogeneous appearance across the site making lateral geologic correlation difficult on a site scale (Luhdorff and Scalmanini, 2006). Furthermore, the uppermost water-bearing zone in which all monitoring wells are screened has weak to no lateral continuity across the site based on the lithologic logs. Based on evaluation of the lithology and well construction details, the consistent anomalously high groundwater elevations, and analytical results from previous monitoring reports, MW-3 appears to be screened in a perched water zone and not within the unconfined to semi-confined aquifers in which the other monitoring wells are screened. Therefore, groundwater in MW-3 does not appear to be in direct hydraulic communication with the other network wells.

1.4 PUMP DETAILS

The wells are equipped to use a WaTerra inertia sampling pump. A dedicated high density polyethylene 5/8-inch OD tube equipped with a one-way valve at the bottom (foot valve) is stored in each well. The polyethylene tubing and foot valve rest on the bottom of the well casing when not in use and extend to within a few inches of the top of the well casing at each well. The foot valve allows water to enter the tubing as it is pushed downwards, and retains the water when the tube is pulled upwards again. The repeated action of raising and lowering the tube lifts the water to the surface in a continuous column. The pump mechanism, which the tubing attaches to, is transported between wells.

1.5 HISTORIC MONITORING RESULTS

The WWRF has been active since February 2005. The WDR required that three monitoring events take place prior to the startup of the WWRF; however, only one monitoring event was performed. Quarterly monitoring commenced in March 2005. Historic monitoring results are summarized below:

- Groundwater levels have ranged from 19.7 to 56.7 feet below top of casing (btoc) or 64.0 to 101.7 feet mean sea level (msl). Groundwater has consistently been the shallowest at MW-3 and the deepest at MW-4. Since the fourth quarter 2008 MW-7 has been dry about 75 percent of the sampling events and has been dry from the third quarter 2013 until the first quarter of 2017 – corresponding to the California regional drought conditions. Table 2 summarizes the historic groundwater levels and Figure 2 displays a line graph of these historical groundwater levels.
- Groundwater flow direction has been consistently towards the northeast to east-northeast. Using MW-1, MW-4, and MW-5R to determine flow direction and gradient, the flow direction has varied from 53.3 to 75.0 degrees and the groundwater gradient has ranged from 0.005 to 0.009 ft./ft. The gradient has gradually steepened and the flow direction has changed to a more easterly direction since monitoring started in 2005. The most recent monitoring event in November 2017 indicates a 3-point gradient of 0.006 ft./ft. and a direction of 75 degrees. Table 3 summarizes historic groundwater flow directions and gradients.
- MW-1 has been consistently up-gradient of the recycled water effluent pond, whereas MW-4, MW-6, and MW-7 have consistently been down-gradient of the recycled water effluent pond. MW-2 is located adjacent to the recycled water effluent pond. MW-5R appears to be an up-gradient well that is recharged from Cache Creek, but is slightly down-gradient to the recycled water effluent pond.

- MW-3 has consistently had higher groundwater surface elevations than the other monitoring wells. Because of this, supplemented by the shallow screen interval, poor recharge, persistent presence of total coliform organisms as well as an overall different water quality than the other wells, and often gray to tan color of the water, MW-3 appears to be screened in a perched water zone. This perched or mounded water table appears prominently in the August 2017 data – but the November 2017 data did not look as pronounced.
- The WDR requires that monitoring wells be sampled and analyzed for the following constituents: pH, total dissolved solids (TDS), sodium, chloride, boron, iron, manganese, nitrate (as nitrogen), nitrite (as nitrogen), ammonia (as nitrogen), total nitrogen, total coliform organisms, and total trihalomethanes (TTHMs). In addition to the WDR requirements, samples collected up to February 2008 were analyzed for fecal coliform. Historical monitoring results are summarized in Table 4. Figures 3 through 9 show concentration trend graphs for the monitoring parameters.
- Metals analyses are required from the monitoring wells. Sampling protocol requires that the turbidity be below 5 Nephelometric Units (NTU) when collecting water samples for metal analyses, otherwise the sample must be filtered prior to being collected and reported as dissolved metals. Due to historical issues with turbidity and purging, the sampling protocol for Q4 2017 was adopted to field filter.
- Total coliform organisms have been sporadically detected at all wells since monitoring commenced. They have been most consistently detected at MW-3, which also has had positive results for fecal bacteria; however, since the second quarter 2013, total coliform organisms at MW-3 have only been detected four times. MW-3 has had past worm-like organisms and has been treated with disinfection products. Recently, no organisms have been visible and the Q3 sampling event had no detections for disinfection by-products, as analyzed for TTHM's.
- Groundwater quality samples were not obtained from MW-7 between November 2006 and November 2016, except for May and August 2011, due to either the well being dry or an insufficient amount of water in the well to collect samples. Since the wet weather in winter 2016 -2017, sufficient amounts of sample water from MW-7 have been retrieved for laboratory analyses – Until November 2017. In

November 2017, there was not sufficient water to purge in MW-7 to collect samples and perform laboratory analyses.

- Groundwater quality analytical results were not available for the fourth quarter 2006 (except for total coliform results), first quarter 2007, and first quarter 2008.
- MW-2 has had historical security issues related to soils and foreign water entering the well vault. Previous reports contain details of this issue.

1.6 GROUNDWATER QUALITY LIMITATIONS

Interim Groundwater Limitations

Borings HB-2, HB-3, HB-7, and B-27 were drilled prior to the startup of the WWRF and within the vicinity of the WWRF. Water samples collected from these borings were used as the background water quality, using the average value for each constituent. Interim groundwater limitations for the WWRF were developed by comparing the basin plan Water Quality Objectives (WQOs) and background water quality data and using the highest value as the interim groundwater limitation. The interim groundwater limitations are listed at the top of Table 4.

The following summarizes how the WWRF monitoring wells have historically compared to the interim groundwater limitations:

- Boron has exceeded the interim groundwater limitations at all wells since quarterly monitoring commenced. Down-gradient monitoring wells MW-2 and MW-6 have had higher concentrations than up-gradient well MW-1.
- Up-gradient MW-1 is typically at or exceeding the interim groundwater limitations for TDS, chloride, nitrate (as nitrogen), and total nitrogen. Historically the TDS, chloride, nitrate (as nitrogen) and total nitrogen results are higher at MW-1 than at any other well in the monitoring well network. However, since 2013 chloride has been highest at down-gradient well MW-4 and nitrate concentrations have been the same at MW-4 as at MW-1 since June 2016 and continuing so through June 2017.
- MW-2, the closest well to the WWRF, regularly exceeded the interim groundwater limitations for total nitrogen prior to 2008, from 2008 through 2016 total nitrogen has been less than the interim limitations. But since 2017, is again above the interim limit. For Q4 2017, MW-2 depicts higher nitrate and total nitrogen than the recent past. Prior to the fourth quarter 2013 the interim groundwater limitations were occasionally

exceeded for sodium at MW-2, but since this time they have been below the interim groundwater limitations, until June 2017 when they again were slightly above the interim limit. Chloride levels at MW-2 exceeded the interim groundwater limitations from the fourth quarter 2010 through the first quarter 2012, but since this time the levels have been less than the interim limitations.

- Quarterly monitoring results at cross-gradient MW-5R and down-gradient MW-4, MW-6, and MW-7 have rarely exceeded the interim groundwater limitations for any constituent, with the exception of chloride and total nitrogen at MW-4 and sodium at MW-6 (with some exceptions).

Final Groundwater Limitations

On January 8, 2008, the RWQCB requested Yolo County prepare a Background Groundwater Quality Study/Groundwater Degradation Assessment Report to establish statistically derived water quality limitations. Central Valley Environmental, Incorporated (CVEI) prepared a Background Groundwater Quality Study/Groundwater Degradation Assessment Report dated April 1, 2009. Yolo County submitted the report to the RWQCB. CVEI used statistical methods to derive tolerance intervals representing the 95th quantile of all water quality sampling results from 2004 through February 2009. CVEI used these values in conjunction with the WQOs, using the greater of the two, to recommend Final Groundwater Limitations. Approval of the Final Groundwater Limitations by the RWQCB is still pending. However, since 2009 the sample population has more than doubled and therefore the analyses may be outdated.

2 GROUNDWATER MONITORING

Groundwater monitoring was performed on November 14, 2017, by SSAL personnel experienced with groundwater sampling. The following sections describe the monitoring protocol used to measure the depth to water, purge the wells, and collect water quality samples from the monitoring wells.

2.1 GROUNDWATER LEVELS

SSAL personnel measured the depth to groundwater at the monitoring wells using an electric water level sounder accurate to 0.01 foot. The sounder was cleaned and decontaminated prior to the first monitoring well measurement and between each well site by thoroughly washing and scrubbing the sounding probe and line with a laboratory-grade detergent (Alconox) and distilled water, followed by a triple rinse with distilled water. The sounding probe and line was then sprayed with a 10 percent bleach solution to kill any bacteria. The sounding probe was allowed to air dry between wells.

2.2 PRE-SAMPLING ACTIVITIES

After the depth to groundwater was measured at a monitoring well, the well was purged. Each monitoring well was purged by lifting the polyethylene tubing that resides in each well and connecting it to the WaTerra Hydrolift II electric pump. Prior to purging, the top 6 inches of the polyethylene tubing was decontaminated. The polyethylene tube was then connected to a vinyl tube via a double-barbed nipple and the vinyl tubing was routed to an empty 5-gallon bucket. The double-barbed nipple and vinyl tubing were cleaned and decontaminated prior to initial use and between each well (primary disinfection). The procedures for cleaning and decontaminating are the same as listed above (Groundwater Levels) except the vinyl tubing received six rinses with distilled water after cleaning.

Prior to collecting the groundwater samples, each monitoring well was micro purged (verbal approval, RWQCB 2008). Micro purging consisted of pumping each well until field parameters such as pH, temperature, and EC stabilized. Field parameters were measured by collecting purge water from the discharge line at select intervals and using a calibrated multi-parameter meter to record the readings. The volume purged and field parameters are documented on purge logs, which are presented in Appendix A. The purge water was collected in 5-gallon buckets and then transported back to the WWRF and discharged to the wastewater holding tanks.

2.3 GROUNDWATER SAMPLING

Once each monitoring well was purged, SSAL personnel collected water samples in laboratory-prepared bottles. Prior to collecting the first sample, the vinyl tube connected to the 5-gallon bucket was disconnected from the bucket and the tip was sprayed with a 10 percent bleach solution to kill any bacteria that may have been present in the bucket and inadvertently transferred to the sampling tube (secondary disinfection). To eliminate any residual chlorine, pumping was then resumed for about 30 to 60 seconds (approximately 0.25 to 0.5 gallons) and the end of the vinyl tube was elevated and pinched so that the entire tubing surface was in contact with the purge water prior to sampling. The bacteriological (total coliform) sample was the first sample collected and was collected directly from the end of the vinyl tube, followed by collection of samples for THMs. The samples for all other constituents analyzed were collected next. Water samples for metals were filtered in the field using a disposable 0.45 micron filter before being placed into acidified laboratory prepared sample bottles. Trip blanks are included by CLS for TTHM's analysis, when requested.

Nitrile gloves were worn while collecting samples. A new set of gloves was used at every monitoring well. The samples were placed in an ice chest and cooled to 4 degrees Celsius and delivered to California Laboratory Services (CLS) of Rancho Cordova, California, a California-certified laboratory, under standard chain-of-custody procedures. Samples collected from the monitoring wells were analyzed for TDS, sodium, chloride, boron, iron, manganese, nitrate (as N), nitrite (as N), ammonia (as N), total N, total coliform organisms, and total trihalomethanes per the WDR requirements. Table 4 presents the results for the monitoring wells and Table 5 presents the results for the trip blank and equipment blank samples. Appendix B contains the laboratory data sheets and chain-of-custody forms.

2.4 GROUNDWATER LEVELS AND FLOW DIRECTION

The measured groundwater levels in each well were subtracted from the surveyed ground surface elevation at each well. Table 2 lists the elevation of the top of the well casing (TOC) (reference point) at each well and presents the current and historic depths-to-water and groundwater surface elevations. The groundwater surface elevations were used to generate groundwater contours from which the groundwater gradient was calculated. Figure 10 shows the groundwater contours and flow direction for November 2017. Groundwater gradients and flow directions were estimated using wells MW-1, MW-4, and MW-5R. Table 3 summarizes these estimates.

3 FINDINGS

3.1 GROUNDWATER LEVELS

Groundwater levels in November 2017 (fourth quarter 2017) ranged from 70.73 to 95.50 feet msl and were within historic ranges. Relative to msl, the highest elevation is 95.50 feet at MW-3 followed closely by MW-1 at 95.15. The lowest groundwater elevation is at MW-4 at 70.73 feet and is consistent with historical trends. This late summer/fall seasonal low water level trend continues and is fairly consistent within the monitoring well network. Table 2 lists the water level measurements. Figure 2 shows the current and historic groundwater levels.

Due to MW-3 being screened within a perched water zone it was left out of groundwater contouring, flow direction, and gradient calculations.

Between the third quarter of 2017 and the fourth quarter of 2017, groundwater levels declined approximately 1.0 to 2.6 feet overall. This matches what is commonly understood to be seasonal variations with wet winter/spring seasons followed by dry summers and early falls. This pattern continued into late summer and early fall (with little regional rainfall) being dry and yielding additional decreases in water levels in the monitoring wells.

3.2 GROUNDWATER FLOW DIRECTION AND GRADIENT

The groundwater flow direction and gradient for November 2017 were calculated using wells MW-1, MW-4, and MW-5R, which is consistent with past practice and historically reported data. Using these wells, the groundwater flow direction was to the east northeast (75.0 degrees) with a gradient of 0.006 feet/feet. The groundwater gradient and direction is consistent with historic results. Figure 10 displays the groundwater surface elevations at each well, the groundwater contours, and flow direction. In the northern portion of the site the groundwater flow direction appears to be influenced by Cache Creek. Table 3 lists the historic and current groundwater flow directions and gradients.

3.3 GROUNDWATER QUALITY

Tables 4 and 5 summarize the analytical results in table format and Figures 3 through 9 show the historical water quality parameter concentrations in graphical format.

Current (fourth quarter 2017) water quality results were compared to historic water quality results to assess potential increasing trends. Overall, the water quality analytical testing results for the third quarter of 2017 were within historical ranges and trends. Of specific note is the pronounced increase in nitrate and total nitrogen at MW-2. MW-2 also had

increased levels this quarter for boron and TDS. One overall trend this quarter was the slight overall increase in pH measurements. However, measurements differences between quarters varied somewhat by individual well and all pH data remains within the WQO range at all monitoring wells. Boron was observed to slightly increase overall as noticed upticks in several wells. Nitrogen and nitrate levels were near recent analytical ranges for all wells except MW-2. The recent increases in water quality parameters at MW-2 could be due to seasonal factors or related to the past well security – sealing issues, or other factor. Overall TDS levels appear very close to historical levels and ranges at each well. The spatial variation of TDS, nitrate and boron concentrations over the recent past are best explained by the recent rainfall/dryness patterns, recharge and pumping changes in the area groundwater. The ammonia levels in MW-3 continue to be a concern and reason to discount MW-3's overall WQ data. No other significant trends in groundwater quality trends were observed from this quarter's monitoring results.

MW-3 continues to be the outlier in water quality as those results are significantly different from the remaining monitoring wells. Further, the consistent high levels of coliform and ammonia are indicators of perched groundwater that is more influence by shallow groundwater than may be influenced more by surface water and shallow ground conditions.

Historically, up-gradient MW-1 has had the highest concentrations of TDS, chloride, nitrate (as N), and total nitrogen. However, beginning in 2013 chloride concentrations at MW-4 have consistently been above those at MW-1 and continued through this quarter (4th 2017). Concentrations in both MW-4 and MW-6 are still below the historic high levels in MW-1.

With the recent pronounced increases in water quality parameters at MW-2, the historic pattern of MW-1 (up gradient) being the location of the highest TDS, Chloride and sodium is no longer the case. MW-2 is now the highest for TDS, nitrate/TN, and sodium. Refer to the water quality figures for additional trends.

The highest nitrate (as N) (21 mg/L) and total N (21 mg/L) concentrations were detected in the samples from MW-2, these levels now exceed those at MW-1 for the current quarter. MW-2 had the highest boron (6.2 mg/L) concentration detected, also consistent with historic results.

Total coliform was detected in the samples from MW-2, 3, and 4 at low levels (4.5 to 540 MPN/100 mL). The level at MW-4 of 540 appears an outlying possibly due to weather or sampling/sample handling procedures. At these levels, no serious contamination threat is considered – however continued caution in sampling protocols and attention to analytical trends is warranted. The coliform positive trend since the last quarter indicated an

improvement in water quality as measured and influenced by field sampling protocols. Total coliform is typically detected in the sample from MW-3 at high levels – it was only modest this sampling event.

Ammonia (as N) was detected at measurable concentrations only at MW-2, 3 and 4; varying from 0.10 to 0.13 mg/L. All others were below the reporting limit of 0.10 mg/L. Ammonia (as N) is not typically detected at any of the wells in the monitoring network (aside from MW-3).

Iron was not reported in any of the monitoring wells for fourth quarter 2017. Manganese was reported at MW-3, consistent with past data and again indicating a partially separated aquifer for sampling at MW-3.

THMs were not detected in any of the water samples from the monitoring wells.

3.4 COMPARISON TO INTERIM GROUNDWATER LIMITATIONS

The water quality results from the fourth quarter 2017 monitoring event show that every monitoring well sampled exceeded the interim groundwater limitation for boron, consistent with historic results.

Based on the understanding that the interim groundwater quality limits remain the higher of the background level for the site and the basin wide WQO (water quality objective), the following is a summary of each wells exceedances for the current quarter for other general mineral analytes (excluding boron).

MW-1: none

MW-2: sodium, total nitrogen, chloride, nitrate

MW-3: not applicable

MW-4: chloride, total nitrogen

MW-5R: none

MW-6: total nitrogen

MW-7: No Data. Insufficient sample volume.

4 CONCLUSION

The groundwater contours and flow directions show there are two potential sources of groundwater to the area. MW-5R monitors water entering the area that is recharged by Cache Creek, north of the WWRF area. Water also enters the area from the south near MW- 1 and MW-2 from regions used for agriculture. MW-4, MW-6, and MW-7 are in a mixing zone between these water sources and as such minor shifts in groundwater gradients may result in a change in water quality that reflects these two different water sources. In 2015 almond orchards were planted in the fields just west of the monitoring area and water wells were installed to provide water for the orchards. Deep percolation from irrigation or pumping could affect groundwater levels and flow directions, but to date they do not appear to be affecting groundwater beneath the WWRF area. In past monitoring events, it appeared groundwater pumping east of the monitoring well network was affecting MW-4 and could be affecting MW-7.

In general, the annual rainfall amounts, irrigation practices at farm lands and golf courses and variations in groundwater pumping to meet local domestic water needs can impact the local groundwater contours, flow direction and gradients. However, for the fourth quarter 2017 monitoring event, these parameters remained within historical ranges for groundwater levels. The most recent GW contours reflect a slight overall decrease from the spring and early summer 2017 levels as expected for seasonal variations and the overall dry period of the fall.

The analytical results from the fourth quarter 2017 sampling event show several results above the interim groundwater limitations. All wells exceeded the interim groundwater limitations for boron, which is consistent with historic monitoring results. Additionally, several wells have chloride and total nitrogen levels slightly above the interim limits.

Notable, MW-2 shows increased levels this quarter for nitrate, total nitrogen, boron, chloride and TDS. This is the second quarter in a row for increases in multiple parameters at MW-2. This well could be having seasonal spikes in parameter levels related to the dry weather (concentrating effect) or MW-2 could be under an undetermined influencing force. This also could be related to seasonal movements of groundwater and gradients in the area, security and sanitary seal concerns around the well area or other factors. Continued vigilance and water quality monitoring should be undertaken to detect any further degradation of the water quality in this area.

MW-6 appears to have a pattern where TDS and chloride concentrations spike upward after the well receives considerable recharge. This could be due to minerals/salts which have been

deposited/trapped in the unsaturated sediments getting flushed and dissolved into solution when groundwater levels rise into these sediments.

MW-1 consistently has several constituents above the interim groundwater limitations since monitoring began, including the initial sampling event prior to the startup of the WWRF. The interim groundwater limitations are based on both WQOs and background water quality data. The borings used to establish background water quality data for the WWRF are down-gradient of MW-1 and therefore do not actually reflect background concentrations for up-gradient MW-1. The higher concentrations at MW-1 are indicative of the groundwater quality up-gradient from the WWRF and not due to the WWRF. Interestingly, for fourth quarter 2017, MW-1 saw a few water quality parameters go lower. This trend will be tracked in the future.

The fourth quarter analyses for THM's resulted in no detections. This indicates a clean and reliable sampling event and data. Past concerns with cross contamination from disinfection protocols were not observed this sampling event.

Review of the current quarter and historical data trends indicate the local groundwater quality appears to remain in historical ranges since before and after the operations of the WWRF.

Wild Wings Water Recycling Facility – Fourth Quarter 2017
Groundwater Monitoring Report
WDR Order No. R5-2002-0077

Notes:

Information for monitoring wells was extracted from Monitoring Well Installation Report (Geologic and Hydrogeologic Study) for the Wild Wings Residential Development , Jacobson Helgoth Consultants, Inc., August 2004.

All monitoring wells were drilled and constructed by PC Exploration of Rocklin, CA. An Ingersol Rand A-400 drill rig with an 8-inch diameter hollow stem auger was used. Oversight was provided by Jacobson Helgoth Consultants. Wellheads were constructed in subsurface vaults with flush mount covers and locking well caps. The top of the PVC casing is approximately 1.3 feet below ground surface (bgs).

TOC = top of casing; surveyed in reference to mean sea level by Morrow Surveying of West Sacramento, CA, on June 26, 2004

Table 4
Groundwater Quality Monitoring Results
Wild Wings Water Recycling Facility, Yolo County, CA

Laboratory Notes:

STL = Severn Trent Laboratory of West Sacramento, CA; BSK = BSK Laboratories of Fresno, CA; TDS = total dissolved solids; NO₃-N = nitrate as nitrogen; NO₂-N = nitrite as nitrogen; NH₃-N = ammonia as nitrogen; (d) = dissolved fraction; TTHM = total trihalomethanes; nd = nondetect

italic font style = Analysis for magnesium, total Kjeldahl nitrogen, fecal coliform and E. coli organisms is not required by RWQCB Order R5-2002-0077.

¹ = Total trihalomethanes consist of the sum of bromodichloromethane, bromoform, chloroform, and dibromochloromethane.

² = See WDRs Item E. 1. Ground Water Limitations; WQ Objective = a variety of applicable regional water quality goals compiled by RWQCB staff; Background = Tolerance Limit (calculated from August 2001 borings and monitoring wells MW-1 and MW-5R)

³ (in Lab Notes column) = Chloroform detection; this compound was also detected in the laboratory method blank; this compound is a common laboratory contaminant.

⁴ = Nitrate (as nitrogen) laboratory result for 5/7/2007 at MW-4 is reported as shown on the laboratory report although the concentration is about four times higher than historic results. It is probable that the concentration was reported for nitrate (as nitrate). Due to the age of the sample, laboratory validation of the result could not be performed.

⁵ = Sample was extracted/analyzed outside the EPA recommended holding time

⁶ = Measured in the field

⁷ = Calculated using field Electrical Conductivity measurement

* = Nitrate as nitrogen and Nitrite as Nitrogen results were combined as one

- = Sample not collected or not measured for this constituent

Notes on Laboratory Data depicted on Figures.

1. MW-7 – Data for NO₃, and TN for 5/7/2007 is not graphed due to concerns with data.
2. MW-5R – Data for Chloride for 6/27/2017 is suspect (dilution factor?) but is shown on graph.
3. Data reported as less than the laboratory reporting limit is shown on figures as “zero”

Table 5
Quality Assurance/Quality Control Samples
Wild Wings Water Recycling Facility, Yolo County, CA

Project Name: Wild Wings Recycling Facility

Enclosed are the results of analyses for samples received by the laboratory on 11/14/17 14:53.
Samples were analyzed pursuant to client request utilizing EPA or other ELAP approved
methodologies. I certify that the results are in compliance both technically and for completeness.

Analytical results are attached to this letter. Please call if we can provide additional assistance.

Sincerely,

James Liang, Ph.D.
Laboratory Director

Notes and Definitions

QM-7 The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS/LCSD recovery.

QM-4X The spike recovery was outside of QC acceptance limits for the MS and/or MSD due to analyte concentration at 4 times or greater the spike concentration. The QC batch was accepted based on LCS and/or LCSD recoveries within the acceptance limits.

HT-F This is a field test method and it is performed in the lab outside holding time.

BT-4 <1.8

DET Analyte DETECTED

ND Analyte NOT DETECTED at or above the reporting limit (or method detection limit when specified)

NR Not Reported

Annual Biosolids Summary

Wild Wings Water Recycling Facility
Biosolids Hauled 2017

Month	Pressed Biosolids (Tons)
January	0.00
February	0.00
March	5.83
April	0.00
May	4.27
June	0.00
July	0.00
August	0.00
September	0.00
October	0.00
November	0.00
December	0.00
Total	10.10
Minimum	0.00
Maximum	5.83
Average	0.84

Month	Liquid Sludge Hauled (Gals.)
January	0
February	0
March	0
April	0
May	25000
June	17500
July	12000
August	19500
September	0
October	0
November	0
December	40000
Total	114000
Minimum	0
Maximum	40000
Average	9500

Pressed biosolids were hauled by Waste Management to the Yolo County Landfill for 2017.

Project Name: Wild Wings - Sludge Sample

Enclosed are the results of analyses for samples received by the laboratory on 09/12/17 12:50. Samples were analyzed pursuant to client request utilizing EPA or other ELAP approved methodologies. I certify that the results are in compliance both technically and for completeness.

Analytical results are attached to this letter. Please call if we can provide additional assistance.

Sincerely,

James Liang, Ph.D.
Laboratory Director

CA SWRCB ELAP Accreditation/Registration number 1233

Notes and Definitions

- QM-5 The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
- QM-4X The spike recovery was outside of QC acceptance limits for the MS and/or MSD due to analyte concentration at 4 times or greater than the spike concentration. The QC batch was accepted based on LCS and/or LCSD recoveries within the acceptance limits.
- QB-1 The method blank or calibration verification blank contains analyte at a concentration above the MRL; however, concentration is less than 10% of the sample result, which is negligible according to method criteria.
- DET Analyte DETECTED
- ND Analyte NOT DETECTED at or above the reporting limit (or method detection limit when specified)
- NR Not Reported
- dry Sample results reported on a dry weight basis
- RPD Relative Percent Difference

ATTACHMENT 5

Wastewater Performance & Compliance

Compliance and Performance of the Wild Wings Water Recycling Facility #R5-2002-0077

The Wild Wings Recycling Facility experienced higher than normal flows intermittently throughout the year of 2017 exceeding the design capability of the facility. The higher flows were due to I/I issues within the collection system. This caused operational difficulties and at times plant washout. We also experienced equipment and a tertiary sand filter failure which in all contributed and caused the following violations:

January, 2017

The daily maximum Total Coliform for the tertiary effluent was exceeded on 1/11/2017 with a 84 MPN/100mL.

We were experiencing high flows on this as we had been for several days due to heavy rain. The chlorine residual at time of sampling was 11.0 mg/l. We believe this result could be attributed to the weather and the extreme flows. This was the only exceedance for the month. There was no discharge to the golf course the entire month.

March, 2017

The daily maximum Total Coliform for the tertiary effluent was exceeded on 3/26/2017 with a 130 MPN/100mL.

This was an isolated event that could be attributed to the high flows we had been experiencing. The chlorine residual at the time of sampling was 11.0 mg/l. The daily results before and after the 26th were in compliance.

May, 2017

We encountered higher than normal flows from May 18th through May 22nd causing the plant to be hydraulically overloaded and causing our secondary clarifier to washout periodically over that time. Our daily flow averages have been 70k to 75k. The flows were:

May 18th 87,600 gals.

May 19th 120,800 gals.

May 20th 105,600 gals.

May 21st 112,100 gals.

May 22nd 98,600 gals.

Equipment Maintenance/Repairs:

- The online turbidity and chlorine meter sample pumps were replaced on May 26th.
- We installed a new chlorine Hach CL17 analyzer to replace the SureFlow unit on June 1st.
- We repaired the SCADA system on June 2nd to restore continuous SCADA recordings of the chlorine and turbidity analyzers.

June, 2017

Due to an oversight, the operator missed the monthly sampling for the month of June. The facility performed well during the month, did not experience any high flows or overloading, nor issues with any of the remaining sampling. Preventative and corrective actions were implemented immediately to preclude missed samples from happening again.

August, 2017

Compliance and Performance of the Wild Wings Water Recycling Facility #R5-2002-0077

The daily maximum Total Coliform for the tertiary effluent was exceeded on 8/13/2017 with a 49 MPN/100mL.

October, 2017

The daily maximum Total Coliform for the tertiary effluent was exceeded on 10/12/17 & 10/13/17 with a 1600 MPN/100m on both days.

Staff replaced the effluent sample pump and put back online. At the time the sample tubing was not disinfected. This has been corrected and no further issues have been noted.

December, 2017

The daily maximum Total Coliform for the tertiary effluent was exceeded on 12/10/17, 12/12/17 & 12/20/17 with a 1600 MPN/100m for each day.

The County contracted with EEI to perform repairs on the failed tertiary sand filter. Repair work began on 12-20-17. In order to affect the necessary repairs, the contractor bypassed the tertiary filter to the recycled storage pond, therefore no e-coli samples were collected during the period December 21 through December 31, 2017 and no tertiary monthly samples collected.
